

Zychrome® is a patent-pending chromium complex consisting of chromium, niacin and L-cysteine (chromium dinicocysteinate). Published clinical research shows that Zychrome supports healthy insulin levels and function. Preclinical research suggests that Zychrome controls cell signal pathways associated with blood sugar regulation.

30% Significant Reduction in Insulin Levels and Insulin Resistance

21% Significant Reduction in TNF- α and 10% Significant Reduction in Protein Carbonyl, Important Markers in Insulin Resistance

Determined GRAS by one of the nations leading toxicology groups.

CLINICAL RESEARCH DEMONSTRATES REDUCTION IN INSULIN LEVELS AND INSULIN RESISTANCE

A published, randomized, double-blind, placebo-controlled study in people with type 2 diabetes showed Zychrome® significantly decreased insulin resistance and fasting insulin levels by 30%. Zychrome also significantly decreased TNF- α levels by 21% and significantly decreased oxidative stress marker protein carbonyl by 10% compared to baseline. TNF- α and protein carbonyl are correlated with insulin resistance. Published preclinical research suggests that Zychrome controls cell signal pathways associated with blood sugar regulation and reduces inflammatory/insulin resistance markers such as CRP, MCP-1 and ICAM-1.

PROVEN SAFETY

Published toxicological studies, including a 90-day repeated oral toxicity study, as well as clinical research demonstrate Zychrome's broad spectrum safety. Zychrome has been determined GRAS.

PRODUCT BENEFITS & CLAIMS*

- Zychrome improves insulin levels.
- Zychrome improves insulin function.
- Zychrome helps manage insulin resistance.
